*Disclaimer;*

*If you have heard some of it before  
it shows that experience and knowledge have and can create  
value as long as it does not shadow the possibilities*

# Trends the last 10 years on NCS

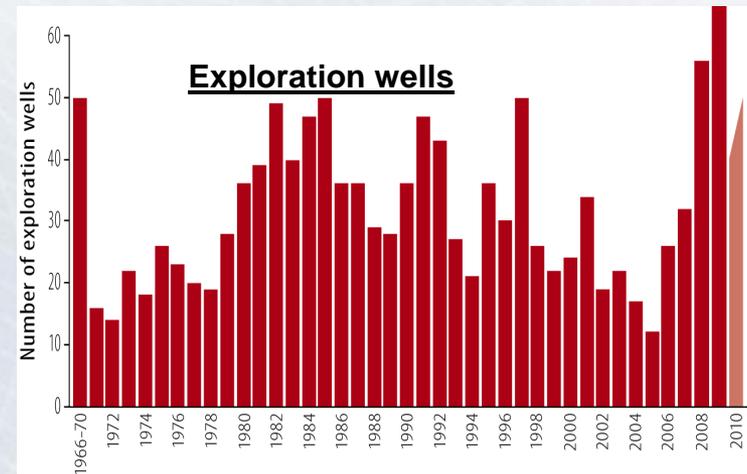

➔ The decline in production is the combined result of reduced exploration and infill drilling and does not only reflect the subsurface potential

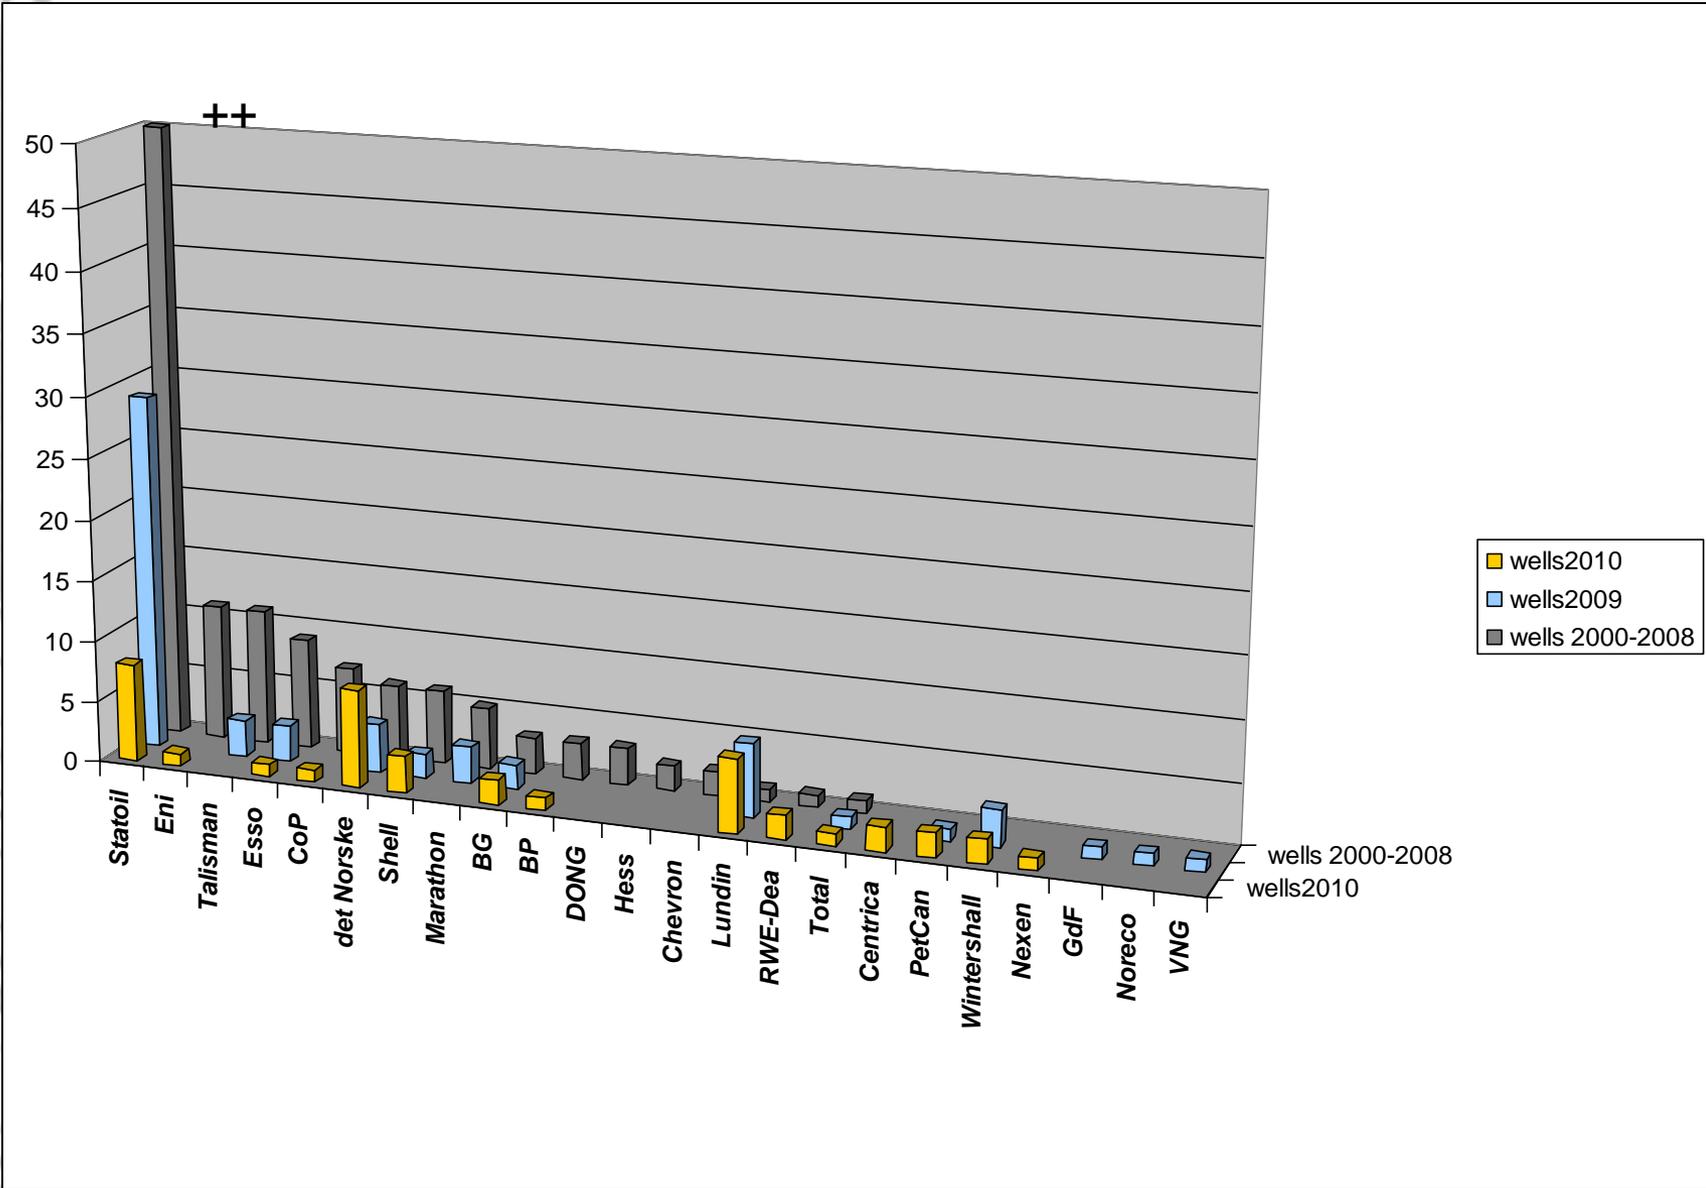

## Drill and find more oil and gas

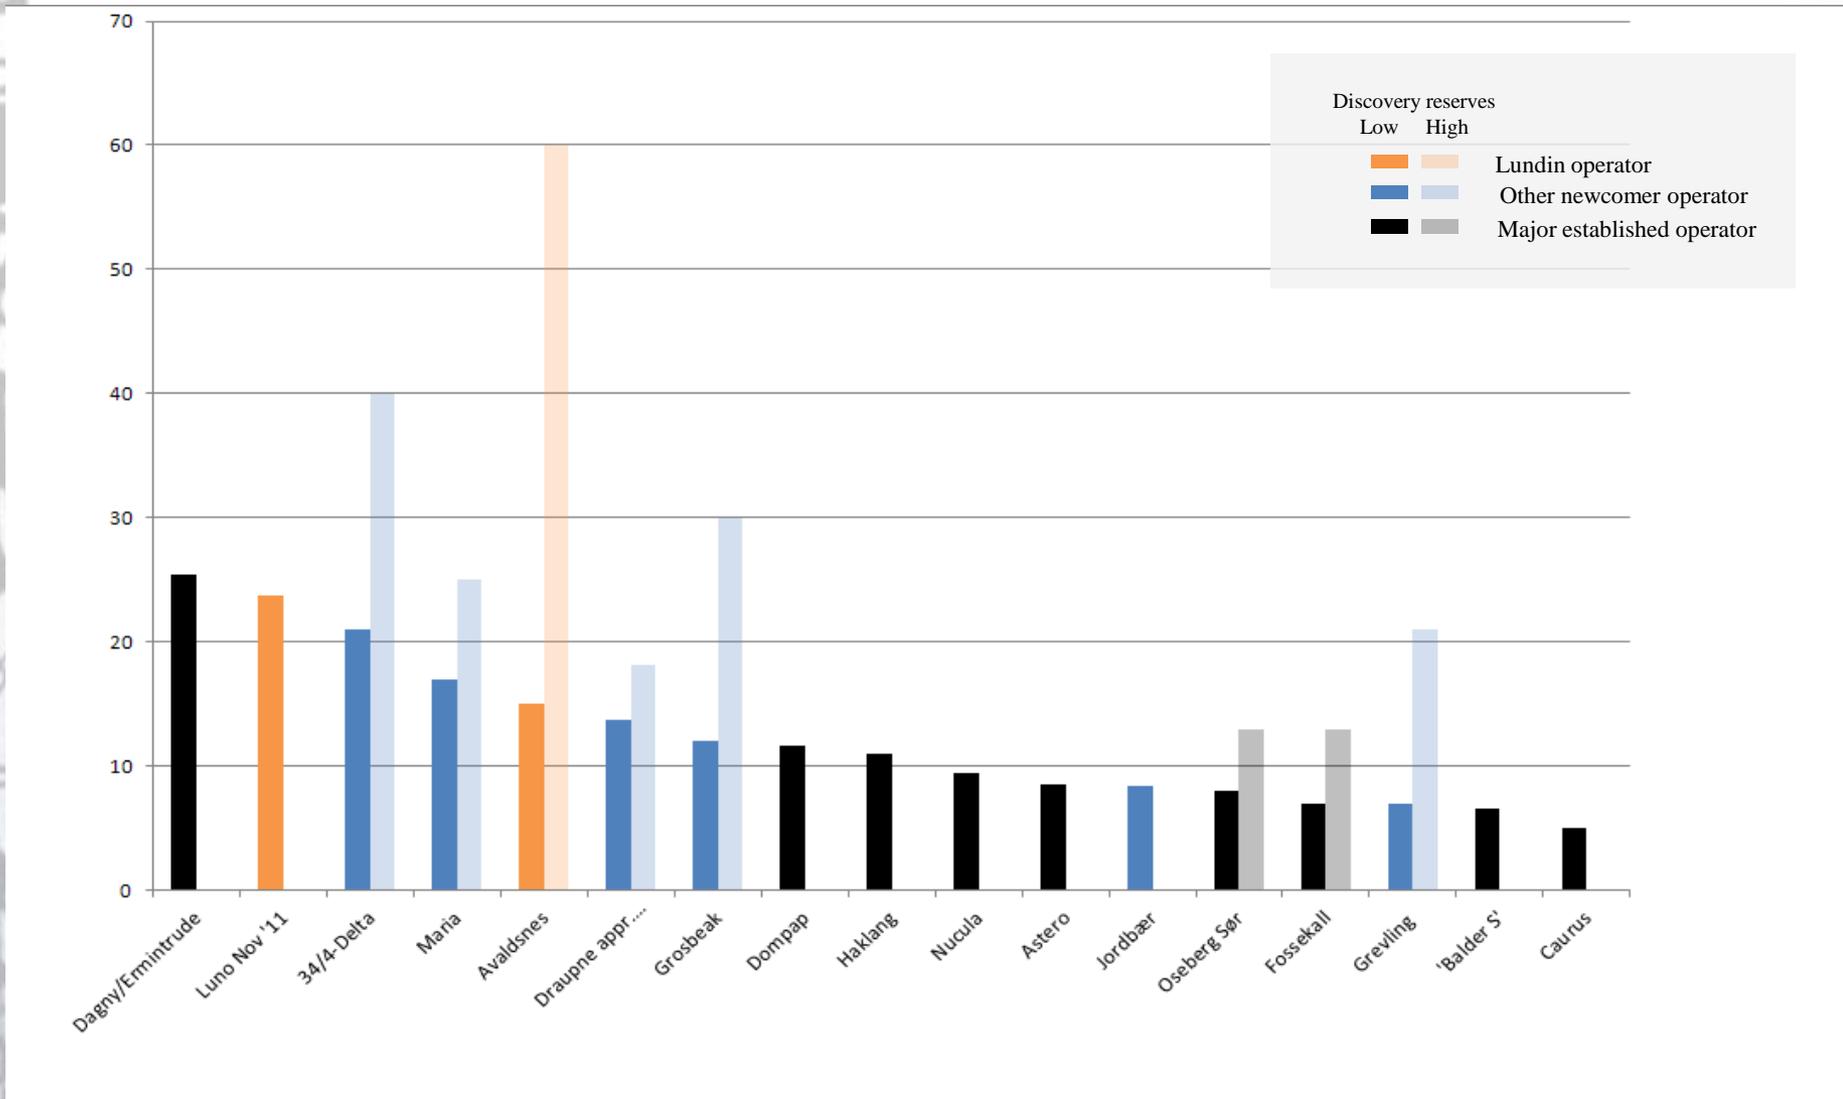

significant volumes

➔ The increased drilling activity is the result of a new company structure on NCS

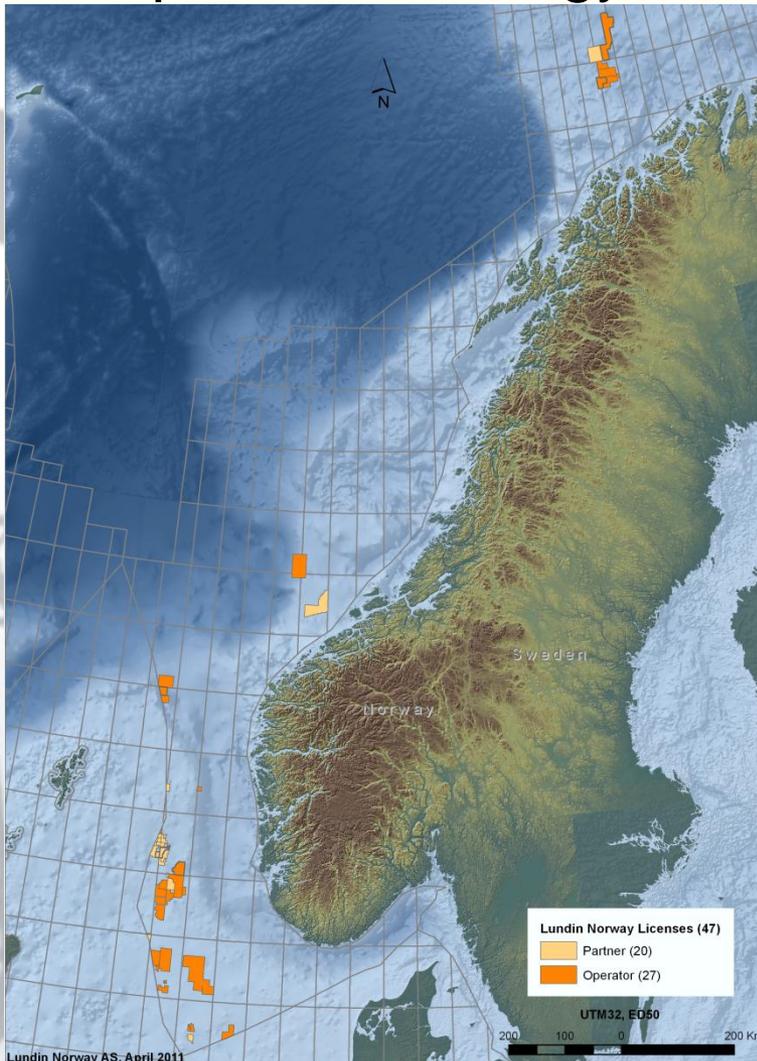

# Changes in exploration and delineation drilling

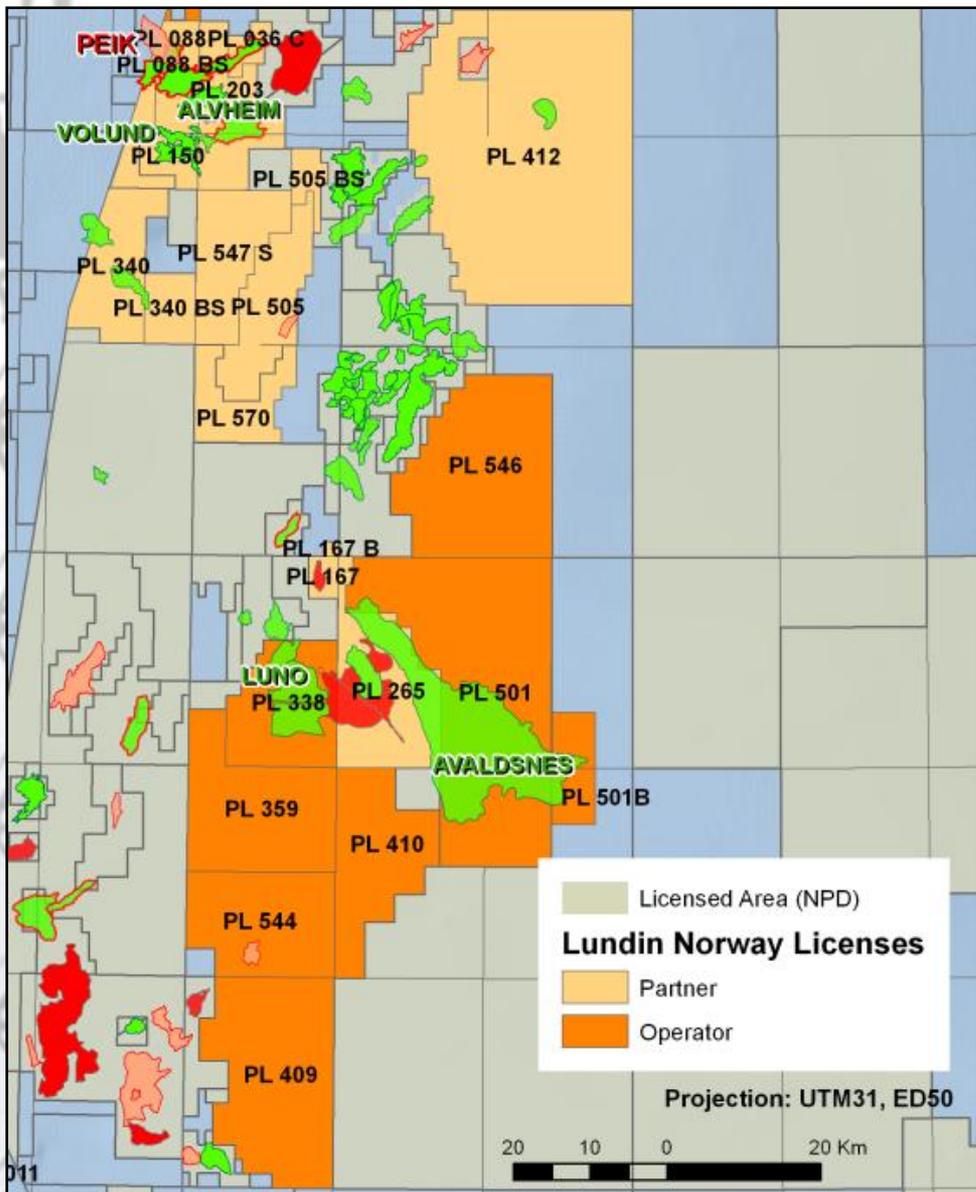

# Lundin portfolio strategy

- Cash flow protected organic growth
- Leverage on what we know and develop new concepts
- Utilise synergy in portfolio in relation to improved exploration and development
- Efficient exploration through early drilling decisions and continuous drilling activity
- Tailor yearly balanced drilling portfolio in relation to
  - Stand-alone frontier exploration
  - Growth exploration
  - Mature tie-in exploration
- Maintain production from existing and emerging developments (Alvheim and Volund)
- Data/fact driven subsurface understanding, with a clear appreciation of the limitations of Data, Tools, Methods and Theories at any time

Lundin production: 23k/day  
increasing to 60 k/day

# Lundin core area

- ➔ Established the Alvheim area as a major light oil province as an active partner
- ➔ 10 Operated wells in the Lundin core area since autumn 2007
- ➔ Established the Haugaland High, a 4th generation exploration area, as a major oil province 45 years after the first award in 1965
- ➔ 10 years with surprises:
  - Alvheim: significant oil field, not a gas satellite
  - Volund: significant oil satellite
  - Marihøne: light under saturated oil
  - Luno: proximal Jurassic reservoir facies with under saturated oil
  - Luno South: basement discovery
  - Avaldsnes: unbiodegraded oil discovery
  - Apollo: serendipity discovery of oil at three levels; Balder, Heimdal and Volgian/Cretaceous
- ➔ No surprise:
  - Dry holes have also been drilled
  - Every well contains a learning base

# Lundin strategy on the Haugaland High

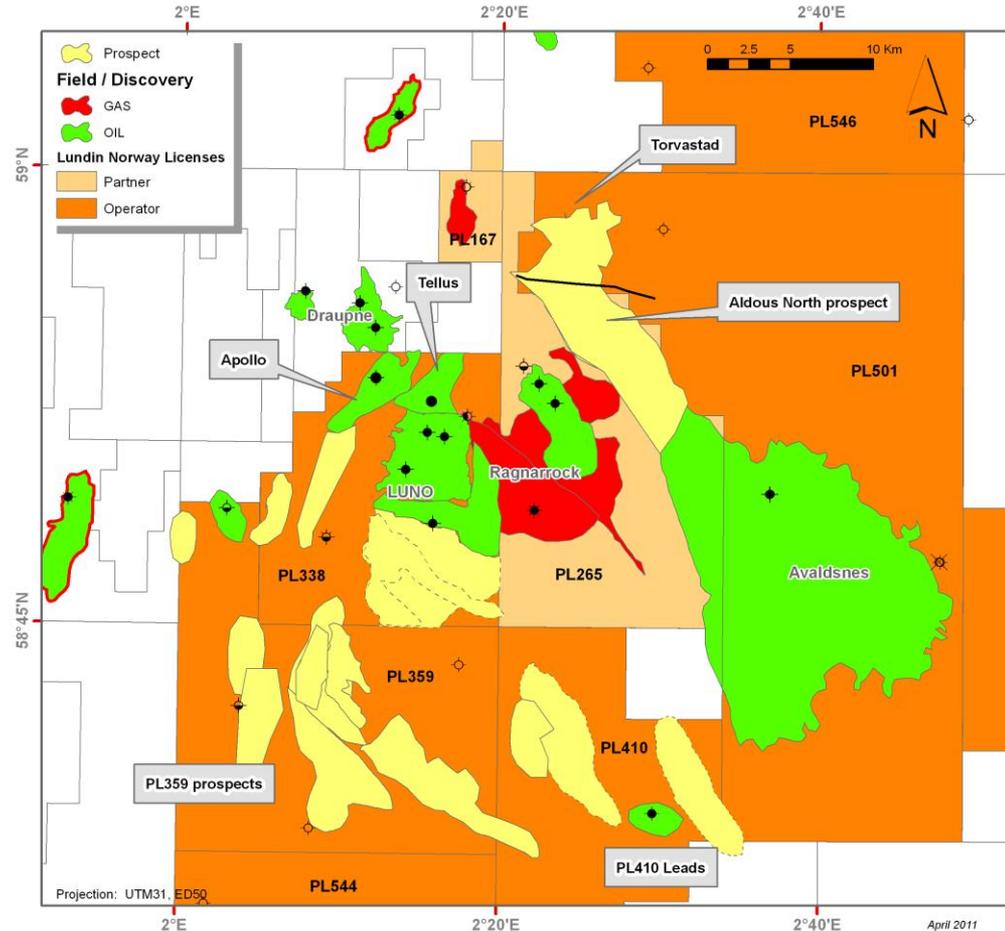

## Operated 7 wells and 4 DSTs

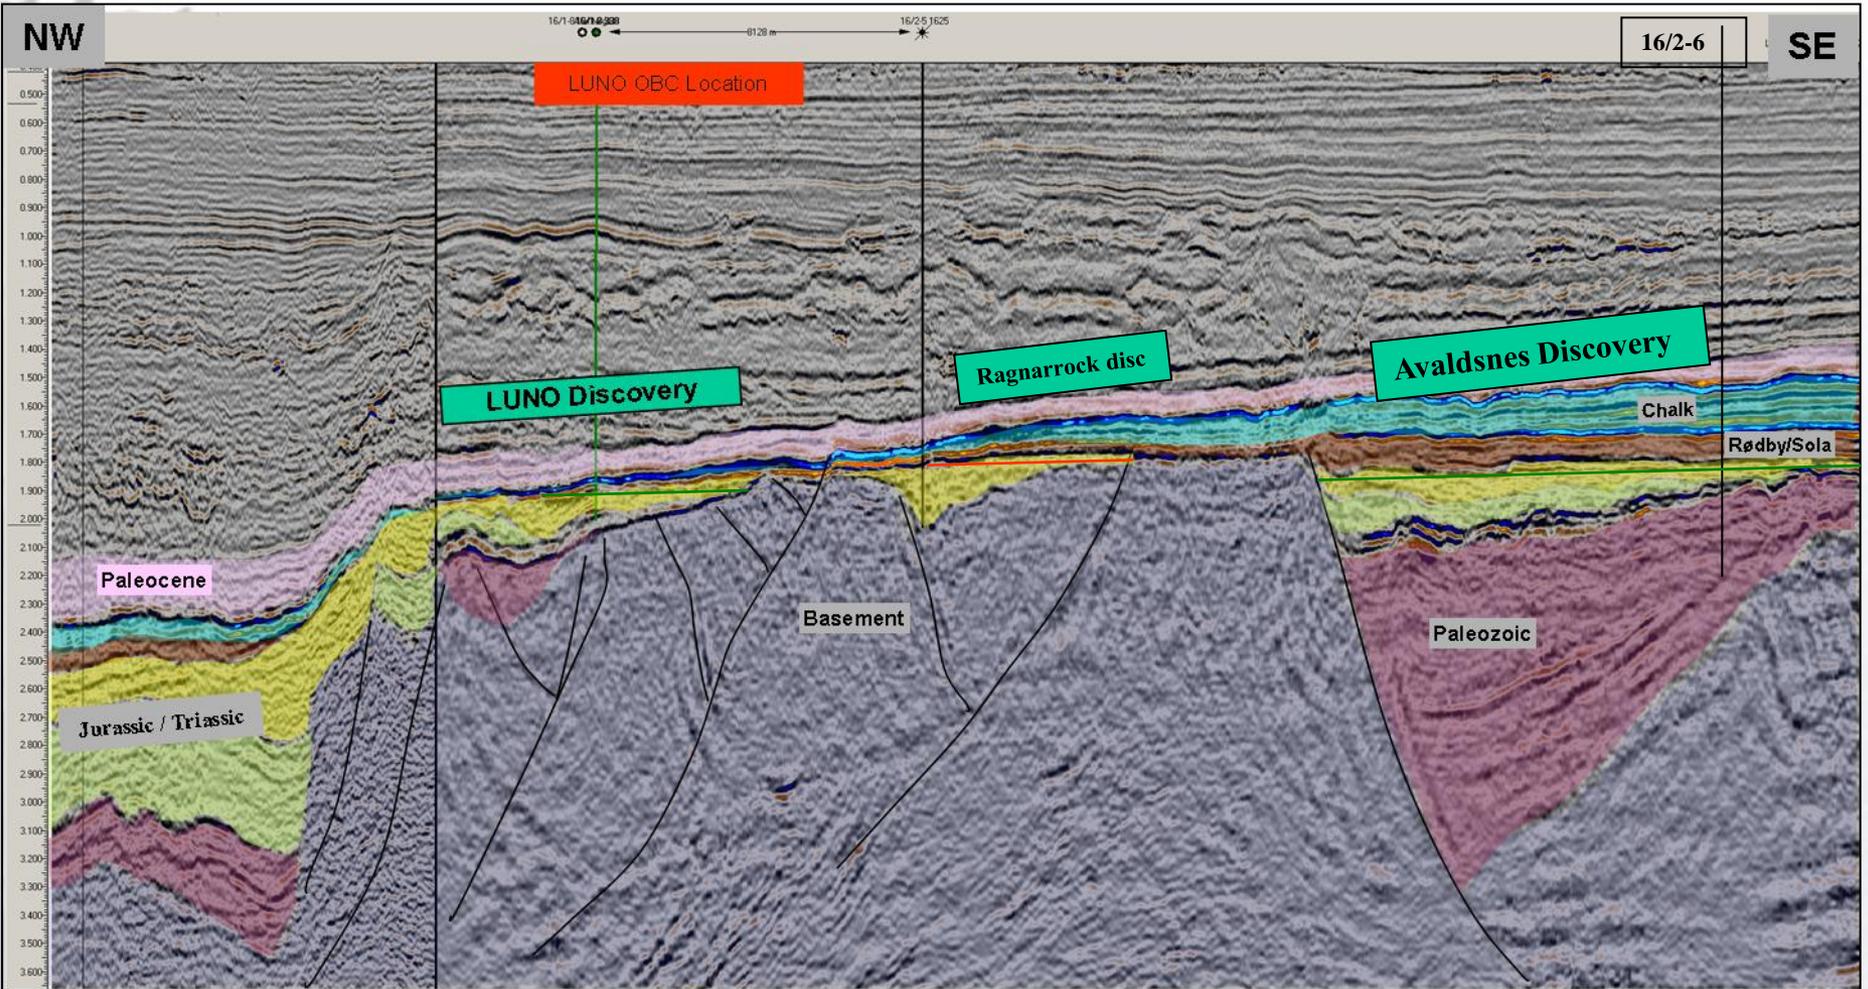

- Cored, SWC, fluid samples, mini-dst, quality logging, technical sidesteps to secure proper logging or coring
- PL 338: 2500 mill NOK
  - 5 wells: 16/1-8, 10, 13, 14, 15 3 DSTs
  - 3D OBC
  - Part of regional 3D 1650 sqkm geostreamer survey
  - Plan for additional exploration drilling to follow the PDO
- PL 359: 220 mill NOK
  - 16/4-5 tight basement
  - New well in 2012
- PL 501: 400 mill NOK
  - 16/2-6, Avaldsnes discovery
  - 16/3-4, 16/2-7, 16/3-4, 16/2-8 and 16/2-9
- PL410:
  - Well to be drilled 2012

## Results: 7 discoveries and 2 upgrades:

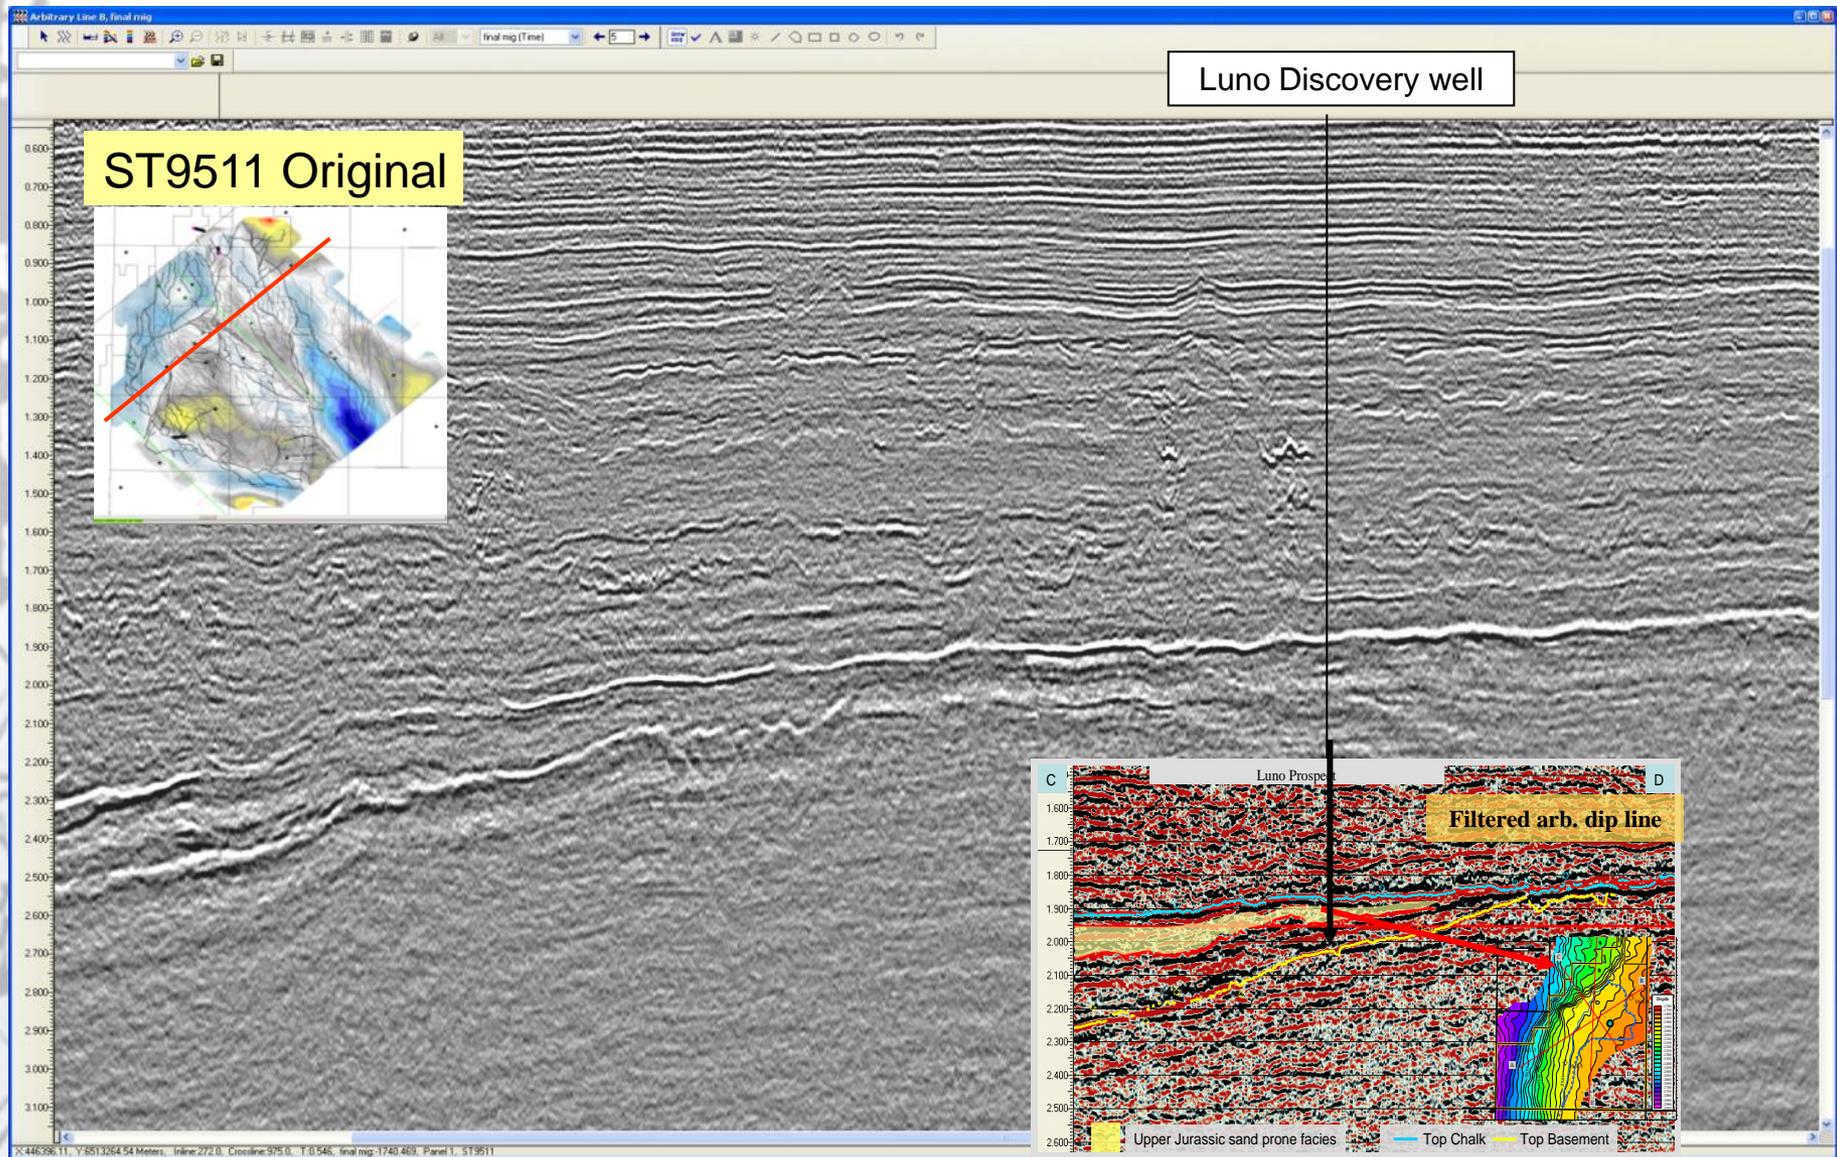

- Luno
- Luno South
- Apollo 3 discoveries
- Tellus
- Avaldsnes
- 16/1-3 upgrade of shows to h-c column
- 16/5-1 upgrade to Luno oil in basement
- Developed several new play types and late migration of light oil
- Introduced new geophysical interpretation techniques

# NW to SE line over the Haugaland High

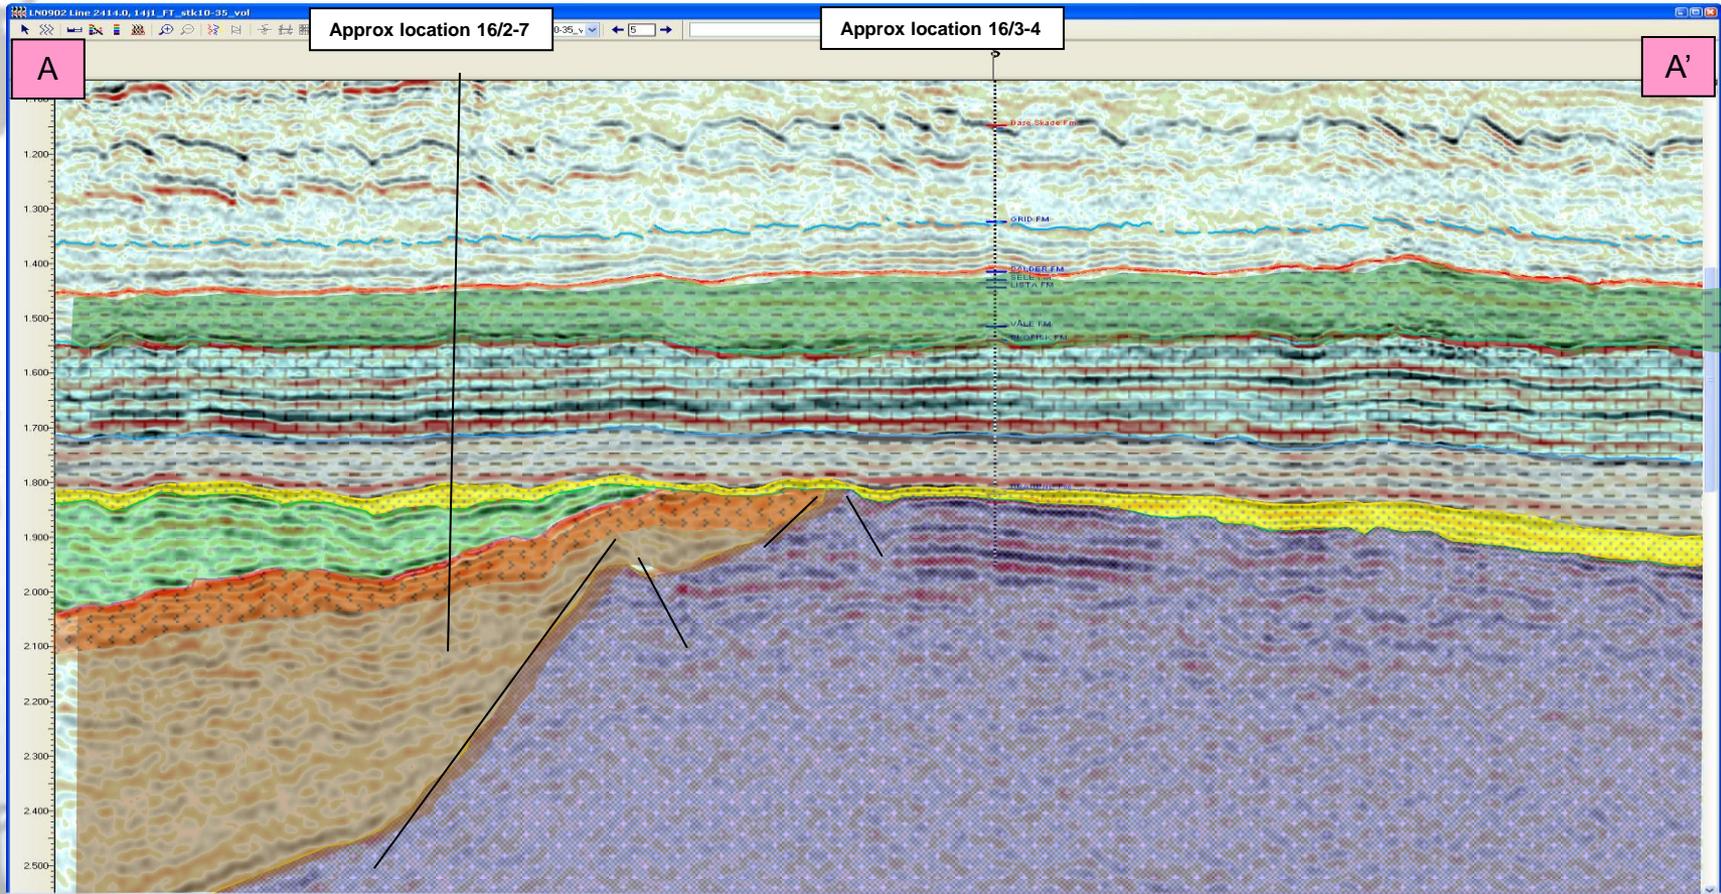

# 3D quality at the time of application

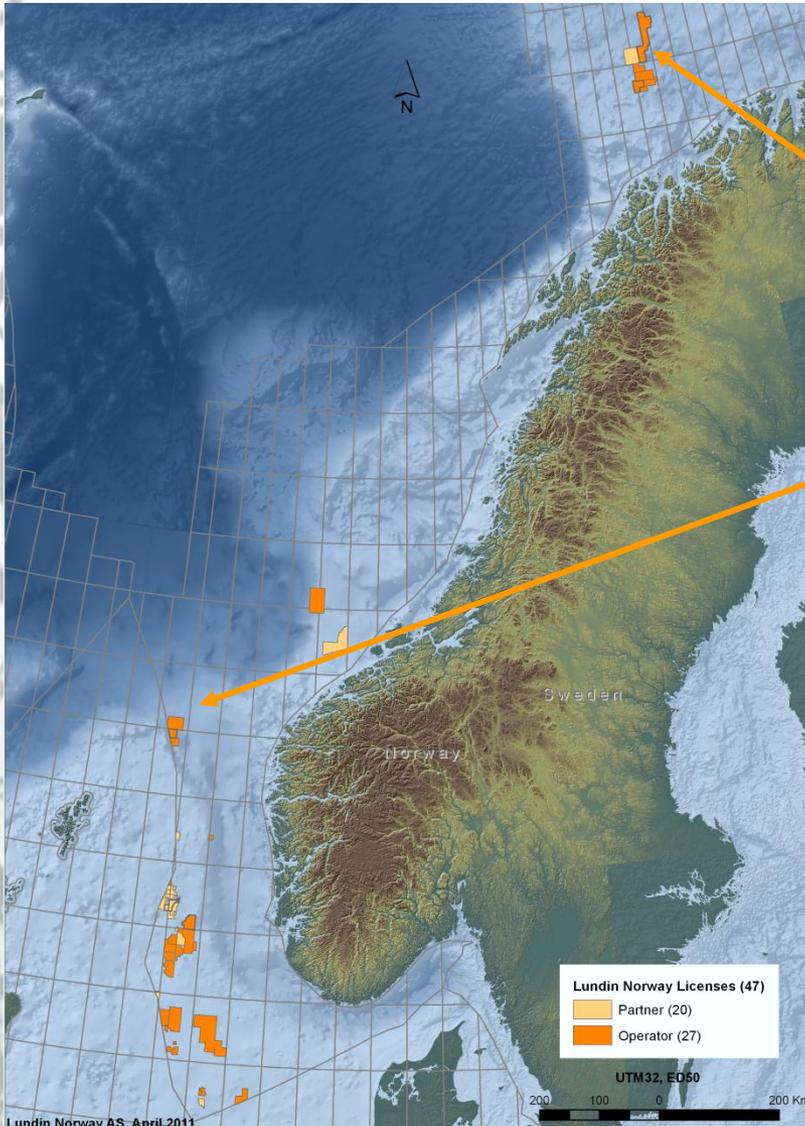

# The Avaldsnes discovery

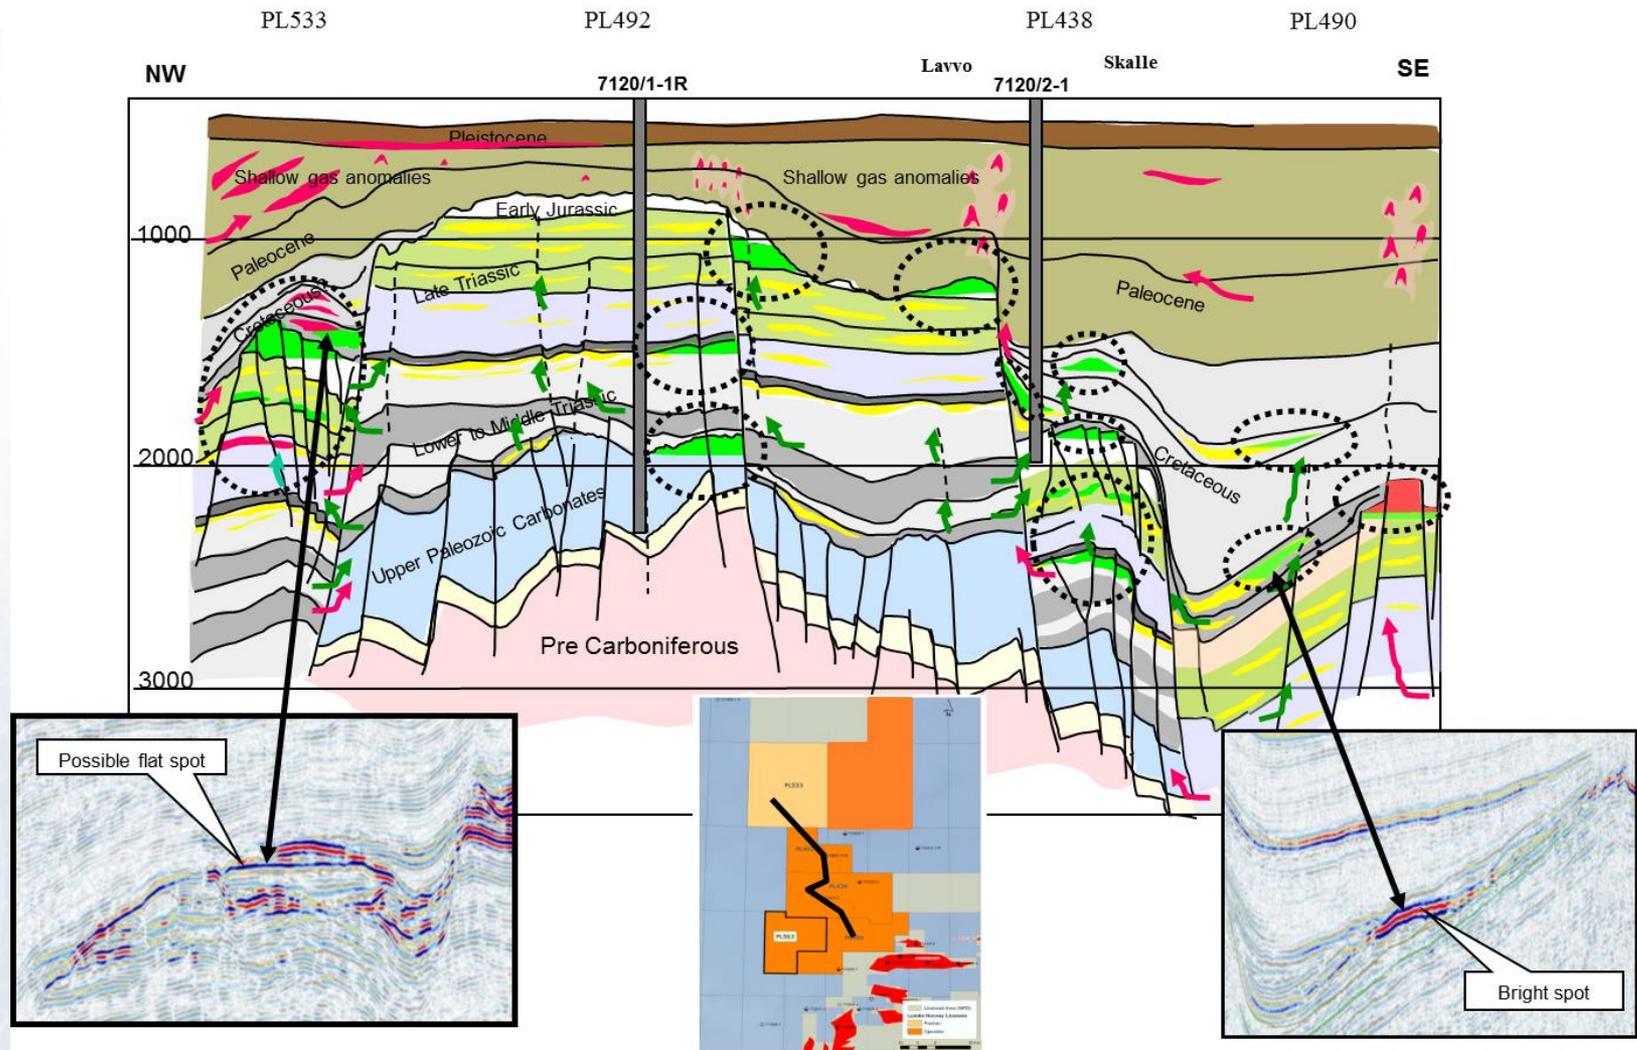

# Lundin portfolio strategy to build new core areas

- Growth beyond proven reserves in the current Alvheim  
Luno/Avaldsnes areas need new core areas:
  - Loppa High; Jurassic inversion
  - Manet High: Jurassic inversion
  - Other areas

# Play types in Lundin's Barents Sea acreage
